## General Care For Stick Insects

All the new insects we carry come from eastern Australia. They are very social and a number of them can be kept together in a single enclosure.

We now have Western Australian Stick Insects from Broome /Augusta Males when older are capable of flying, where as females will not be able to do so.

### Food:

They feed on a variety of Eucalyptus species such as Soft leaf Wattle Species, The Dwarf Peppermint Tree *Agonis Flexuosa Nana* and some are quite fond of rose leaves.

Setting up their food is quite simple. Small cuttings of their food can be placed into a container of water. This will allow the stick insects to feed on the upright stems of leaves.

Drill holes through a lid of a container for the stems to go through. This will prevent young stickies from downing in the open topped container. Misting leaves with fresh water daily is essential to maintaining a healthy environment for your stick insects.

- *Spray Bottles Code No. S160* -
